

GORDA - IST FP6 004758

Resubmission of Deliverable D4.4 - Note to the reviewers (to be included in the formal response to the 3rd period review report)

The current version of Deliverable D4.4 is version 1.1 and addresses the critics and suggestions made in the 3rd review report of the project.

3rd review report: "The deliverable is a 24-page report that describes the Sequoia architecture at a very high level (for instance, it is not clear what a virtual database is), and the GORDA API compliance even at a higher level. "

The report provides an overview of the Sequoia system, its architecture and particular aspects relevant to the adaptation to the GORDA requirements (GORDA interface). The current deliverable has been extended to provide further details as requested: eg. Section 2.1.3, and Chapter 4.

3rd review report: "According to the document, deliverable D4.4 supersedes deliverable D4.2, because it improves: the scheduler for optimistically synchronized protocols (no description found), and because the scheduler now supports stored procedures and ODBC clients. "

The current version of the report indeed extends the superseded D4.2 in the added functionality but also in the exact details of the work that since D4.2 has been carried. With regards to the new functionality of schedule, section 3.2 is devoted to it. At this time, it was also found adequate to include a new chapter on the plans for the maintenance and further development of Sequoia/G.
